

Questions & Answers on the usage of Remuda® Full Strength

What is Remuda Full Strength?

Remuda is a 41% concentrate of glyphosate herbicide the same active ingredient as Roundup®. It is a non-selective systemic material that controls both broadleaf weeds and grasses. Remuda is systemic so it goes through the leaves to kill the underground roots.

What weed does Remuda control?

Most all green tissue is affected. Therefore do not get it on desired plants or they will be killed. Remuda is weak on controlling nutgrass, malva (cheese weed) and ivy.

How does Remuda work?

Remuda must be absorbed into the plant to control it. Generally, it takes about 4 days on young annuals and 7 days or more on perennial plants/weeds. The warmer the temperature, the faster Remuda works.

Should a surfactant be added in the tank mix?

No. There is a surfactant already in Remuda.

How long after application should it be before rainfall or irrigation is put on the treated plant/weeds?

Give it at least 6 hours to become rain fast.

Does Remuda have residual control?

No. It controls through the plant foliage; it has no soil activity. Therefore weeds that germinate after the application will need to be controlled at a later time.

What rate do I apply Remuda?

Remuda does have the best rate range of any glyphosate product on the market. Spray to cover the weeds thoroughly.

For young annual weeds	2 tablespoons per gal. of water
General weed control	5 tablespoons per gal. of water
Hard to kill weeds such as perennials, trees and bushes	26 tablespoons per gal. of water

When can I plant seeds after a Remuda application?

I would wait about 7 days.

What precautions should I observe?

The biggest is to avoid accidental application to desired plants. Do not spray when the wind is blowing. Keep animals away from treated area until the spray has dried on the plant.

How is Remuda packaged?

Remuda is available in pints, quarts, gallons and 2.5 gallon bottles.
