

CYCLONE BOOSTER FAN PLUS: OPERATING INSTRUCTIONS

Step 1: For manual control, simply set the switch to **ON** and the fan will be activated and setting the switch to **OFF** will then turn it off.

Step 2: For automatic control, set the switch to either **HOT** or **COOL** depending on whether you are heating or cooling your home. The fan will activate upon sensing warmed or cooled air.

Step 3: Tune the TEMPADJUST dial to your desired level of sensitivity.

NOTE: Synching your new Booster Fan Plus to your thermostat may take a few adjustments on your part. The range is about ten degrees from most sensitive to least sensitive in either HOT or COOL mode. For example; in HOT mode and on the most sensitive setting, the fan will automatically turn on when it senses even slightly heated air whereas in the least sensitive setting the air would have to be heated significantly.

Again, it may take a few adjustments to get the Cyclone Booster Fan Plus in-sync with your thermostat or air conditioning system. For clarification, the Booster Fan Plus will not turn on immediately with the furnace, rather it will turn on when the tempered air is sensed.

Watch the helpful instructional video! <https://cyclonerangehoods.com/booster-fans/>

Once you have your Booster Fan Plus tuned to your thermostat you will never have to worry about it again. Just set it and forget it!
