

Tillandsia Air Plant Medusae:

- Air plants are freestanding and do not require soil.
- Lighting: Tillandsias (Medusae) thrive in a variety of indoor lighting conditions, but a room with medium to bright light and a north or west facing window is best. Do not keep your plant in direct sunlight.
- Water: Immediately after receiving your Tillandsias they will benefit from a 2-3 hour soaking in water as their journey can be stressful. Lower leaves that have naturally died back can be easily removed by pulling them down towards the base of the plant.
- Temperature: Tillandsias can be kept outdoors year-round if protected from frost. Optimum temperature range is between 70 and 90 degrees F
- Other Tips: Indoor care is similar to outdoor care. To get enough light, Tillandsias should be within 3 feet of a window. It is often dryer indoors, so more water may be required. They should dry out within 4 hours of a watering unless you are rehydrating them with an overnight soaking. It is easiest to water indoor plants by dunking them or run them under the faucet.
- Air plant Ideas: terrarium, refrigerator magnet, chandelier, wire frame, wood boxes, mix with other plants, place on driftwood, place on stones, display in wine glass display in clear fish bowl with pebbles on the bottom, mount on trees, hang on wall using fish wire.
