

USE AND CARE MANUAL

For proper installation of the Soil Separator™.

The trench and backfill should be mostly dry when installing the pipe and Soil Separator™.

After installing the pipe and Soil Separator™, immediately backfill the trench, do not leave the trench open exposed to rain or sunlight.

Failure to comply with the installation guidelines will seriously affect the performance and life of the system.

Q- What is Soil Separator™?

A- Soil Separator™ is a durable and lightweight fabric to be used as a means of separating the gravel and soil backfill in a trench. This non-woven (spun bonded polypropylene) fabric exceeds all industry standards and weighs a mere 0.5 ounces per square yard. The Soil Separator™ can either be used as a Trench Cover or as Trench Wrap.

Q- How long will Soil Separator™ last in my application?

A – We guarantee Soil Separator™ for as long as the pipe and sock are in the ground out of direct sunlight. The fabric should last around 100 years out of direct sunlight.

Q. Does the Soil Separator™ come in a variety of sizes?

A – Soil Separator™ is available in 150' x 36" wide rolls but other widths and lengths are available by special order.

Q – How do I apply numerous feet of Soil Separator™?

A- Roll the fabric the length of your trench and lay ontop of the gravel before backfilling with dirt for a Trench Cover Application or Roll the fabric the width of your trench, fill with gravel, lay your pipe, fill with more gravel and then wrap the ends of the fabric around the gravel for a Trench Wrap application.

Q- How do I install the pipe and Soil Separator™ for my application?

A- We recommend contacting your local drainage contractor, Extension Service or corrugated pipe manufacturer.
