

CM300/ Booster Fan Plus Maintenance

You will need: #2 Phillips Screwdriver, motor oil or a long lasting lubricant

Step 1: Using the #2 Phillips screwdriver, remove the 4 screws on the exterior of the unit

Step 2: Remove the product housing to expose the interior

Step 3: Pull the fan away from the housing to expose the lubricant reservoir

Step 4: Take some time to clean the unit of any dust/ debris trapped on the fan blades

***Compressed air can be used to do this**

****A damp cloth can be used to clean the housing and external components**

Step 5: Using motor oil or another long lasting lubricant, apply 1 to 2 drops into the centre of the lubricant reservoir.

Wipe away any excess lubricant and return the lubricant reservoir to the end of the fan blade housing.

Make sure to firmly secure the lubrication reservoir to the motor housing when finished.

Reverse these steps to put the unit back together and test the Booster Fan.
