

Installation Guide for PVC Pipe Slip x Slip Unions

PVC unions and PVC pipe union connectors are pipe fittings designed to connect two pipes together without the use of a sealant or traditional glued coupling.

The advantage of using PVC pipe unions is that the pipes that are connected using PVC pipe unions can be taken apart and put back together again without the use of specialized tools.

This means that wherever you use a PVC union to connect pipes together these pipes can be disconnected and worked on with relative ease.

Steps:

1. Unscrew the slip union assembly (separates into 2 sections)
2. Clean each end of the 2 PVC pipes to be connected
3. Apply PVC cement to to each end of pipes
4. Insert pipe ends into one of the slip union sections
5. Screw the Union together
