Spectra Touch™ Shower FAQ's

Q. My shower sprays will not change when I touch it.

- A:
1. Make sure the battery compartment is loaded with the batteries and in the correct direction.
 2. Make sure all of the plastic wrapping is removed from battery.
 3. Make sure you touch on the outer ring around the face, not the face itself.
 4. Try to use two or more fingers and/or more pressure to touch the ring
 5. Open the battery compartment and check if there is any water inside, dry the water and replace with new batteries.
 6. Turn off the water and restart it again.

Q. There is leak from the nozzles when switching to a different spray.

A: That's not the leak, it's the residual water inside the shower, and it will take a few seconds to drain out the water. This is perfectly normal.

Q. My shower changes the sprays by itself.

- A:
1. Check that there is no leak where the showerhead and shower arm connects. If there is a leak please review the installation instructions to apply provided sealing tape on the shower arm and tightly secure the showerhead onto the arm
 2. Please shut off the water and restart it.

Q. My shower shows a slow response to the touch and/or slow to change sprays.

A: The shower batteries are designed for **3- 6** months based on average usage. Try changing the batteries to resolve the problem

Q: The soft spray (center spray) is clogged and the spray is not properly working

A: Use a toothbrush to gently brush the plate with some vinegar. Do not dip the shower in vinegar/water to clean
