

The aluminium is a material with excellent chemical, physical and mechanical properties. It is lightweight, tough, ductile, malleable and highly durable.

## Placement

To see the video, capture this image with your mobile phone (software QR code reader is necessary) or click on it.

1. Spread a big amount of gripping material on the surface where you will install the profile.
2. Then, place the profile and press it to let gripping material pass through the mechanized holes of the fixing wing.
3. Place a tile on the fixing wing and press it to achieve an optimal contact with the gripping material.
4. Repeat the process, placing tiles along the fixing wing of the profile.
5. Finally, clean the remaining material and let dry.

## Cleaning and maintenance

The product must be cleaned periodically with a soft mop. If you use a neutral liquid cleaner, you must rinse the profile with cold water and dry it to remove the humidity excess. The persistent dirtiness can be removed by using cleaning approved agents lightly abrasive or a grid covered with polished powder neutral.

Steel wool, abrasive cleaners, souring products as well as strong acids (hydrochloric and perchloric), strong bases (caustic soda or ammonia) or carbonated solutions are not recommended. Citric acid is neither recommended because it dissolves the protective layer of the surface of aluminium. Waxes, petrolatum, lanolin or similar substances are not appropriate. Solvents containing haloalkanes (hydrofluoroether and chlorinated solvents) and curing accelerators containing chlorides should not be used (use special accelerators free of chlorides).
