VITREOUS CHINA FACTS AND CARE

Vitreous China is a Ceramic material that has been glazed with enamel. When an intense amount of heat is applied to powdered glass, the result is a liquid called vitreous enamel that can be used to coat small objects such as sinks and toilets. Vitreous China has a smooth, shiny surface that won't stain or fade and resists scratches and abrasions. It is also chemical resistant and impossible to burn.

Care and Maintenance

2

BARCLAY

Vitreous china is very easy to care for. Simply rinse thoroughly with a mild liquid non-abrasive detergent such as dishwashing liquid, then make sure you wipe dry with a soft cloth. A mild abrasive cleaner may be used for more heavy duty cleaning. Use toilet bowl cleaners inside of the bowl only. Do not use in-tank cleaners as they can damage the flush valve. Strong abrasive cleaners or pads will remove the gloss or matte finish and sratch and dull the surface. Avoid soft-scrub type of cleaner on a regular basis
