

Helpful Installation Tips

For Your New Watts Faucet

During shipping the toggle bolt on your new faucet may push up out of position. Prior to installing hold the faucet as shown in the picture pull down on the wing nut this will make sure the orings are in their proper position and your faucet will have a good seal.

Disassembling your faucet is never recommended this could void your warranty. If you have to remove the fitting at the end of the toggle bolt you must insert the 3/8" blue tube **prior** to reconnecting the fitting. There are small orings that could be pushed out of position if the blue tube is not fully inserted first.
