# CADLE: RAIL® Step-by-Step Installation for Wood Frames

#### TOOL CHECKLIST

- Safety Glasses
- Work Gloves
- Pencil
- MeasuringTape
- ElectricDrill
- Drill Bits
- Hammer
- Cable Cutters
- Vise-Grip Pliers
- □ 7/16" Wrench
- ElectricGrinder withGrinding Disk& Cut-off Disk
- Hacksaw or Electric Reciprocating Saw
- Cable Lacing
   Needle
- Feeney Tension Gauge

Mark drill hole locations on posts.

To minimize cable deflection, space cables no more than 3 inches apart and have a post or vertical spacer at least every 3 feet. Also, straight runs of cable (no turns/dips) should not exceed 70 feet. Runs with corners (2 bends at most) should not exceed 40 feet. See Frame Requirements on back page.

Drill holes in posts. Hole diameter depends on cable size and type of fitting. See chart below.

1/8" | 5/16" | 1/4" | 3/8" 3/16" | 3/8" | 1/4" | 9/16

If desired, Quick-Connect®SS posts may be through drilled at 1/4" and then counter-bored with the recommended Quick-Connect®SS drill to countersink the fitting.

Insert Protector Sleeves at necessary locations.

Tap in until flush.

Protector Sleeves prevent abrasion at angled transitions on wood posts (e.g. stair transition posts or outside faces of double corner posts).

Insert the Threaded
Terminal through the
Terminal end post and
attach a flat washer and
Snug-Grip® Washer-Nut.
Spin the nut 2 full
turns. Strong resistance
will be felt as the SnugGrip® threads engage;
so hold the Terminal
shaft with pliers.

Lace the free end of the cable through the intermediate posts and Quick-Connect®SS end post. Slide-on a flat washer and Quick-Connect®SS fitting until they rest against the face of the post.

Use a Lacing Needle if snagging becomes a problem.

Use Beveled Washers for stair termination posts with angled holes. Available for Threaded Terminal and Quick-Connect®SS fittings. Always install the Quick-Connect®SS fittings in the top stair post to prevent rain water from running down the cable into the fittings.

Hold the
Quick-Connect®SS
fitting with one hand
and pull the cable
tight with the other.
The fitting
automatically locks
when you release
the cable.

Tension the cables by holding the Threaded Terminal shaft with Vise-Grip pliers and spinning the Snug-Grip® Washer-Nuts with a wrench. A Feeney Tension Gauge may be used to check uniform tension. See tensioning sequence diagram at left.

Use hacksaw, reciprocating saw, or electric grinder with cut-off disk to saw off the excess threads as close to the Snug-Grip® Washer-Nut as possible. Touch-up with electric grinder. The special Snug-Grip® threads prevent the nut from loosening.

Important Note: If using electric or pneumatic tools to tighten the Washer Nuts,

spin the nuts very slowly otherwise they will heat-up causing the threads to seize.

Use cable cutters or electric grinder with cut-off disk to trim the excess cable. Grind flush the exposed cable ends with an electric grinder.

Snap on end caps over the exposed Quick-Connect<sup>®</sup>SS fittings and the Snug-Grip<sup>®</sup> Washer-Nuts. You're done.

Feeney SteelProtect™ can be applied for lasting protection of stainless steel cable and parts.

## Cables can terminate or run through corner posts

#### Terminating

Continuous

DOUBLE WOOD POSTS

## Wood Frame Requirements

Railing frames need to be designed and built strong enough to support the tension of properly installed cables, which is a load in excess of 300 lbs for each cable. Here are some basic guidelines to help you properly prepare your railing frames. These guidelines apply whether you are using 1/8", 3/16" or 1/4" cable (1/4" cable not recommended for wood frames).

#### Minimum sizes for all corner and end posts

All other posts should be sized as required for top rail support strength or for code

4X6 WOOD 3-1/2" wide, 5-1/2" thick

#### The Basic Frame Design

#### **Spacing From Walls:**

Set end posts 3 to 4 inches away from the house/wall face to allow access for attaching cable end fittings.

#### based on load strength needs **End Posts:** and local code requirements. Use minimum end post sizes noted above, and Set railing height per securely bolt or screw to joists or deck surface. local code. MAX. 3 FEET Intermediate **Double Corner Posts:** Maximum Post Spacing:

Size all intermediate

posts as required for

strength or for code.

top rail support

Posts:

#### Top Rail:

Always include a strong, rigid top rail that is securely fastened to all posts. Top rail size is

#### Wood Blocking (WOOD FRAMES ONLY):

Cable

Spacing:

Maximum 3

inches apart.

Underneath the top rail attach minimum 1"x 4" wood blocking between posts to provide additional lateral reinforcement to the posts so that they won't pull out of plumb when the cables are tensioned.

If possible use double corner posts to allow the cable to run continuously through the corners without terminating (see single corner post option below). Securely bolt or screw posts to joists or deck surface and use minimum corner post sizes noted above.

- Space cables no more than 3 inches apart
- Space posts/verticals no more than 3 feet apart
- Observe minimum end/corner post sizes shown above
- Securely fasten all posts and top rails
- Carefully plan all termination and corner posts for proper clearance, positioning, and maximum cable run lengths
- Straight runs of cable (no turns/dips) should not exceed 70 feet; runs with corner bends (2 bends at most) should not exceed 40 feet

### And Some Other Options

Space all posts and vertical

spacers (see below) a maximum

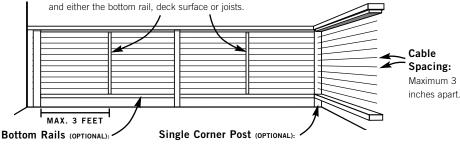

of 3 feet apart to minimize any

deflection that may occur if the

cables are ever forced apart.

#### Vertical Spacers (OPTIONAL):

Slender spacers may be used instead of some of the larger intermediate posts to achieve a more open railing design. These are non-structural members and are only intended to maintain cable spacing and minimize deflection. Examples are 2" x 2" wood strips, 1" metal tubing or 1/4" flat bar. Attach spacers to the top rail

Bottom rails should be spaced no more than 4 inches above the deck surface, or as required by local code, and should be sized as needed for support strength and design appearance.

When terminating on a single corner post, be sure to offset the drill holes at least 1/2" to allow internal clearance for the cable fittings. Use minimum end post sizes noted above and securely bolt or screw to joists or deck surface.

For railings we recommend spacing the cables no more than 3 inches apart and placing posts or vertical members no more than 3 feet apart.

Please note that since building codes vary by state, county and city, our recommendations may not comply with code requirements in all areas.

Always consult with your local building department before starting your project.
